PROFILE

Software engineer in Amsterdam with two years of production delivery across a Scala/GraphQL backend, a React web app and a React Native client, earned while completing an MSc in Computer Science (VU / UvA, 8 / 10, July 2026). I ship features end to end from schema to UI, debug to root cause, and report results honestly when they come back null.

EXPERIENCE

Software Engineer | Setso, Amsterdam

Sep 2024 – Present

Production-management software for film and TV, live at 10 production companies. Part-time alongside the MSc to Aug 2026, full-time since. Seven-person team; six-repository polyglot microservice architecture running as containerised services on Terraform-provisioned infrastructure.

- Shipped 34 features and 90 improvements across the Scala/GraphQL API, React web app and React Native client, owning 9 end to end from schema and resolvers through to UI, including one change spanning four repositories.
- Cut p90 production bug resolution time 39%, from 26 days to 16, by closing 157 defects (30% of every bug the team resolved) and fixing each at root cause across the Scala, TypeScript and React services rather than at the reported symptom.
- Raised automated test coverage 5.3×, from 615 to 3,271 cases, and grew CI/CD from 2 workflows to 50 by building pull-request gates, Maestro mobile E2E suites and one-click rollback deploys.
- Merged 441 of 469 pull requests opened (94%) across six repositories in 16 months, at a median of 108 lines and 20 hours to merge, sustaining daily delivery throughout the MSc.
- Reviewed 234 pull requests spanning 217,000 lines across seven repositories, requesting changes on 30%, including Go services outside my primary stack.

Teaching Assistant, Software Design | VU Amsterdam

Feb 2024 – May 2024

- Mentored five student teams to project completion in design patterns, software architecture and UML by running weekly design reviews and grading 15 project deliverables.

EDUCATION

MSc Computer Science | VU Amsterdam & UvA (joint degree). Final average 8 / 10 2024 – 2026

BSc Computer Science | VU Amsterdam. Final grade 8.3 / 10 2021 – 2024

PROJECTS

MindSafe — MSc Thesis | VU Amsterdam / University of Amsterdam

2025 – 2026

Multi-agent reinforcement learning for safe conversational AI. github.com/kuuroooo/MindSafe

- Isolated the latent-similarity term of a multi-agent RL safety reward through controlled ablations across 4 model variants, 5 training checkpoints and 2 held-out evaluation seeds, reporting a null result once inter-seed spread (0.014) proved the same order as the measured effect (0.023).
- Engineered a three-agent training system in Python and PyTorch as LoRA adapters over a frozen Llama-3-8B, run as a distributed multi-process job across a four-GPU node with a separately served 70B judge model.

SKILLS

Languages TypeScript, JavaScript, Scala, Python, SQL

Frontend React, React Native, Vitest, Maestro (mobile E2E)

Backend and infrastructure Scala/JVM services, GraphQL, Terraform (infrastructure as code), Docker, FastAPI, Elasticsearch

Delivery CI/CD pipelines, pull-request review, automated testing, agile delivery, Linear, Claude Code

Machine learning PyTorch, distributed multi-GPU training, LoRA fine-tuning, LLM evaluation

Languages spoken English, German, Luxembourgish (fluent); French, Mandarin (conversational)
